△ : SAFETY CRITICAL COMPONENT.

1. Operation

1-1 Power stabilized circuit

The output voltage is controlled automatically by IC901, which outputs a constant 12 V voltage (12 ± 0.2 V).

This IC contains an overcurrent protection circuit which is designed to cause the output voltage to drop to 0 V automatically if the output current exceeds 2.5 A.

1.2 Video signal input circuit

The video signal and the intensity signal (hereinafter referred to as INT. signal) which are received by the TTL IC HD7404 drive the video amplifier (Q203, Q204) directly, and they are output to the CRT cathode. Q210 is in OFF when both the video signal and the INT. output signal are being output. As a result of this, the video signal level and the picture on the screen do not change even if the contrast VR value is changed. Since Q210 is put in the ON state when the INT. signal is not output, changing the contrast value causes the branch point to move. Thus the brightness level changes and the contrast picture appears on the screen.

1-3 Vertical deflection circuit

Sawtooth oscillation voltage is generated by C607 charge and discharge. During vertical fly-back, C607 is charged by IC701 pin No. 2 and a switching transistor built into the IC. During scanning the electric potential lowers gradually, because C607 is discharged by R607 connected to IC terminal pin No. 3 and vertical linearity volume (VS690 ⑥). When the electric potential reaches that electric potential of IC terminal pin No. 1, charge is restarted by switching transistor built into the IC, and electric potential returns to the fly-back.

The output voltage sent to the deflection yoke is amplified by the amplifier circuit built in the IC, and output from IC terminal pin No. 8. This IC incorporates a voltage booster circuit to reduce power consumption, and uses diode D601 and condenser C608 connected to IC terminal pin No. 5 and IC pin No. 7 to boost the fly-back voltage up to about 24 V.

1.4 Horizontal deflection circuit

(1) AFC circuit

The triangular waveform voltage generated by the fly-back transformer pulse is sent to IC pin No. 14. The synchronous signal is sent directly to the AFC circuit from the synchronous isolation circuit built into the IC. Both phases are compared at the AFC circuit, and the current in proportion to the phase difference is output from IC pin No. 13. This current is sent to the horizontal oscillation circuit via R701 to control the oscillation waveguide constant.

(2) Oscillation circuit

Oscillation voltage of the triangular waveform is generated by C702. C702 is charged by R702 and H. HOLD volume VS690 ①, and discharged by the circuit built into the IC. From this triangular waveform a square wave of 1:2 is generated, which is output from IC pin No. 9.

(3) Shunt regulator circuit

Vcc source power of the AFC circuit, oscillation circuit and horizontal predrive circuit is supplied from the shunt regulator circuit. Hence, the horizontal circuit of this IC operates by supplying 6-7 V to IC pin No. 10.

(4) Horizontal drive output circuit

A 500 mA p-p current must be supplied to the base of horizontal output transistor Q702. Hence, the oscillation voltage is amplified by drive circuit consisting of Q701 and T701. When Q702 continues, fixed voltage accumulated in C773 passes through the horizontal coil. Hence, linearly increasing current passes through the coil. When Q702 enters a discontinuity mode, current which has so far passed through Q702 passes through C771 and C772. As a result, a resonance is caused by the condenser and coil.

At the half resonance cycle the current direction is half-turned. Thereafter current passes through damper diode (D710). If Q702 enters a continuity mode again while the current passes through diode D701, the cyclic sawtooth current passes through the coil.

The resonance caused by the condenser and coil generates a 200 Vp-p pulse voltage. This voltage is boosted by T702 (FBT) and supplied to each electrode, video output circuit, etc. of the CRT.

2. Repair table

Turn the power source ON and connect the input signal.

3. Troubleshooting

No raster appears. (1) Trouble in power source circuit and horizontal deflection circuit.

(Horizontal circuit)

Positions measured	Voltage	Function
IC701 pin No. 9	0.3 V	Drive output
IC701 pin No. 10	6.5 V	Power source
IC701 pin No. 11	1.3 V	Oscillation
Q701 base	0.3 V	
Q701 collector	11.0 V	
Q702 base	-6.4 mV	
Q702 collector	20.0 V	

No raster appears. (2) Trouble in FBT peripheral circuit.

No raster appears. (3) Trouble in video circuit

Symbol	Positions measured	Voltage
(A)	Q201 base	3.1 V
(B)	Q201 collector	10.4 V
(C)	Q201 emitter	2.5 V
(D)	Q202 emitter	11.1 V
(E)	Q202 collector	6.1 V

Note: Conditions for measuring the voltage.

- (1) Receive an all-white signal.
- (2) Standard brightness and contrast status.

Symbol	Positions measured	Voltage
(A)	Q203 base	1.4 V
(B)	Q203 collector	5.2 V
(C)	Q203 emitter	0.8 V
(D)	Q204 base	5.8 V
(E)	Q204 collector	40.6 V
(F)	Q251 base	0.4 V
(G)	Q251 emitter	0.6 V

Note: Conditions for measuring the voltage.

- (1) Receive an all-white signal.
- (2) Standard brightness and contrast status.

Positions measured	Voltage	Function
IC701 pin No. 1	4.8 V	Synchronous input
IC701 pin No. 2	7.2 V	Oscillation
IC701 pin No. 3	4.0 V	Oscillation
IC701 pin No. 4	12.0 V	Power source
IC701 pin No. 5	1.8 V	Booster output
IC701 pin No. 6	2.1 V	Deflection feedback input
IC701 pin No. 7	11.7 V	Boost voltage input
IC701 pin No. 8	5.7 V	Drive output

No synchronization is available.

Positions measured	Voltage	Function
IC701 pin No. 13	3.3 V	AFC output
IC701 pin No. 14	2.2 V	AFC input
IC701 pin No. 15	4.6 V	Synchronous signal input
IC701 pin No. 16	1.9 V	Synchronous isolation output

IMPORTANT NOTICE FOR SERVICE PERSONNEL BEFORE SERVICING

PLEASE READ BEFORE ATTEMPTING SERVICE

1. While the monitor is in operation, do not attempt to connect or disconnect any wires.
2. Make sure the power cord is disconnected before replacing any parts in the monitor.
3. When the power is on, do not attempt to short any portion of the circuit. This shorting may cause damage to the transistors in the monitor.
4. When servicing the H.V. area, be certain that the C.R.T anode is safely discharged to ground before removing the anode cap.
5. Caution must be exercised when servicing this monitor.

The regulator has no current limiting and even a momentary short of an output voltage could cause destruction of the pass transistors.

IMPORTANT SERVICE SAFETY INFORMATION FOR MODEL KX-1212 KX-1213

Operation of monitor outside of cabinet or with back removed involves a shock hazard. Work on these models should only be performed by those who are thoroughly familiar with precautions necessary when working on high voltage equipment.

Exercise care when servicing this chassis with power applied. Many B plus and high voltage RF terminals are exposed which, if carelessly contacted, can cause serious shock or result in damage to the chassis. Maintain interconnecting ground lead connections between chassis, escutcheon and picture tube dag cluster when operating chassis. The +B Adj. Control in this monitor is sealed in order to protect the user from X-ray irradiation. The +B Adj. control should not normally have to be adjusted. But if it is, or if it is replaced due to damage, check the +B voltage to assure that it is within specifications after adjustment. Then seal this control according to the manufacture's specification.

Certain H V failures can increase X-ray radiation. Monitors should not be operated with H V levels exceeding the specified rating for their chassis type. The maximum operating H V specified for the chassis used in these monitor is $13.8 \text{ KV} \pm 0.5$ at zero beam current with a line voltage of 120 V AC. Higher voltage may also increase possibility of failure in H V supply.

It is important to maintain specified values of all components in the horizontal and high voltage circuits and anywhere else in the monitor that could cause a rise in high voltage or operating supply voltage. No changes should be made to the original design of the monitor. Components shown in the shaded areas on the schematic diagram and/or identified by Δ in the replacement parts list should be replaced only with exact Factory recommended replacement parts. The use of unauthorized substitute parts may create a shock, fire, X-irradiation, or other hazard.

To determine the presence of high voltage, use an accurate, high impedance, H V meter connected between the second anode lead and the CRT dag grounding device. When servicing the High Voltage System, remove static charge from it by connecting a 10 K ohms resistor in series with an insulated wire (such as a test probe) between picture tube dag and 2nd anode lead. (AC line cord disconnected from AC supply.)

The picture tube used in this monitor employs integral implosion protection. Replace with a tube of the same type number for continued safety. Do not lift picture tube by the neck. Handle the picture tube only when wearing shatter-proof goggles and after discharging the high voltage completely. Keep others without shatter-proof goggles away.

When removing springs or spring mounting parts from the chassis, shatter-proof goggles must be worn. Keep others without shatter-proof goggles away.

***** SAFETY INSPECTION *****

Before returning the monitor to the user, perform the following safety checks:

***** PROTECT YOUR CUSTOMER *****

1. Inspect all lead dress to make certain that leads are not pinched and that hardware is not lodged between the chassis and other metal parts in the monitor.
2. Replace all protective devices such as non-metallic control knobs, cabinet back, adjustment covers, shields, etc.
3. To be sure that no shock hazard exists, a check for the presence of leakage current should be made at each exposed metal part having a return path to the chassis (jack, cabinet metal, screw heads, knobs, shafts, etc.) in the following manner.

Plug the AC line cord directly into a 120V AC receptacle. (Do not use an Isolation Transformer during these checks.) All tests must be repeated with the AC line cord plug connections reversed. (If necessary, a non-polarized AC adapter plug must be used for the purpose of completing these checks. Do not otherwise operate the monitor with an adapter.) If available, measure leakage current using an accurate leakage current tester. Any reading of 0.35 MA or more is excessive and indicates a potential shock hazard which must be corrected before returning the monitor to the owner.

If a reliable leakage current tester is not available, this alternate method of measurement should be used. Using two clip leads, connect a 1500 ohms, 10 watts resistor paralleled by a 0.15 MF capacitor, in series with a known earth ground, such as a water pipe or conduit, and the metal part to be checked. Use a VTVM or VOM with 1000 ohms per volt, or higher, sensitivity to measure the AC voltage drop across the resistor. Any reading of 0.35 volt RMS or more is excessive and indicates a potential shock hazard. This must be corrected before returning the monitor to the owner.

Outlined product

This machine is a 12" display monitor used as a terminal connected to IBM personal computers. TTL separate signals are used for the input.

Features

This display monitor is designed for use with the IBM personal computer.

The display monitor uses the latest 12-inch CRT with 90-degree deflection and anti-implosion mechanism. This enables display of fine images.

The latest semiconductor technology and high-quality architecture have resulted in high reliability and performance for heavy-duty use.

Operation

1. Insert the AC power plugs of both monitor and computer in the AC power outlet.
2. Connect the connector cable provided on the rear panel of the monitor to the computer, with the attached video cable. (See the figure below.)
3. Turn on the power switches of both monitor and computer, and the power lamp (green LED provided at the top right of the front panel of the monitor) lights and then the raster (or image) appears on the screen.

Connection Example

LAMP AND CONTROLS

Adjusting The Display

1. **CONTRAST**
The contrast becomes higher as the CONTRAST control is turned clockwise, and becomes lower as it is turned counterclockwise.
2. **BRIGHT**
The screen becomes brighter as the BRIGHT control is turned clockwise, and becomes darker as it is turned counterclockwise.
3. **V. HOLD**
When the screen image flows or overlaps vertically, adjust the V. HOLD to get the correct image. (See illustration 1.)
4. **H. HOLD**
When the screen image appears to give a horizontally striped pattern or the image shifts left or right, adjust the H. HOLD to get the correct image. (See illustration 2.)
5. **V. SIZE**
When the vertical size of the screen image is too short or too long, adjust the V. SIZE to get the correct size. (See illustration 3.)
6. **H. SIZE**
When the horizontal size of the screen image is too short or too long, adjust the H. SIZE to get the correct size. (See illustration 4.)
7. **V. POSI.**
When the screen image shifts vertically, adjust the V. POSI. to get the correct image. (See illustration 5.)
8. **H. POSI.**
When the screen image shifts horizontally, adjust the H. POSI. to get the correct image. (See illustration 6.)
9. **FOCUS**
Adjust the FOCUS so as to get the sharpest image. (See illustration 7.)
10. **V. LIN.**
Adjust the V. LIN. so that the height of characters is even over the whole screen. (See illustration 8.)
11. **SUB-BRIGHT**
Turn the BRIGHT control to maximum and the CONTRAST control to minimum. Adjust the SUB-BRIGHT control (R283) just before the video with an intensity signal disappears.

Problem		Remedy	Problem		Remedy
1	The screen image flows vertically. 	Adjust the V. HOLD control.	5	The screen image shifts up. 	Turn the V.POSI. control counter-clockwise.
2	The screen image appears to give a horizontally striped pattern. 	Adjust the H. HOLD control.		The screen image shifts down. 	Turn the V. POSI. control clockwise.
3	The vertical size of the screen image is too short. 	Turn the V. SIZE control counter-clockwise.	6	The screen image shifts right. 	Turn the H. POSI. control counter-clockwise.
	The vertical size of the screen image is too long. 	Turn the V. SIZE control clockwise.		The screen image shifts left. 	Turn the H. POSI. control clockwise.
4	The horizontal size of the screen image is too wide. 	Turn the H. SIZE control clockwise with the attached core rod.	7	The screen image is unfocused. 	Adjust the FOCUS control with the attached screw-driver.
	The horizontal size of the screen image is too narrow. 	Turn the H. SIZE control counter-clockwise with the attached core rod.	8	The height of characters is uneven over the whole screen. 	Adjust the V. LIN. control.

KX-1212 KX-1213 SPECIFICATIONS

GENERAL SPECIFICATIONS

CRT (Braun) tube:
12" 635 mmR

- Screen:
Non-glare
- Phosphor:
P39, PUL

Input signal:
T.T.L. Level Separate signals.
H.SYNC: TTL compatible positive sense.
V.SYNC: TTL compatible negative sense.

Source voltage:
Commercial use power source for each country

Power consumption:
24 W (0.22 A)
